# Lecture 17: Clustering and density estimation

**Professor Ilias Bilionis** 

### Density estimation using Gaussian mixtures

#### Density estimation

Your are given n observations:

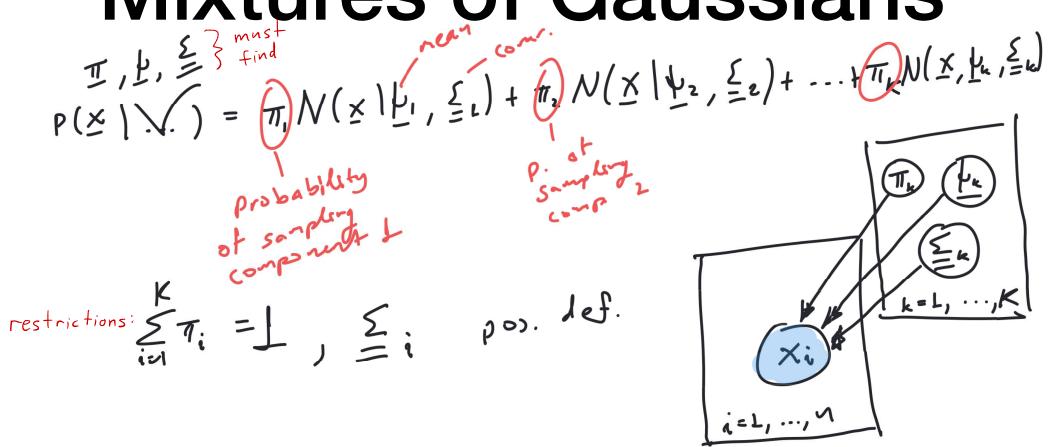

$$\mathbf{x}_{1:n} = \{\mathbf{x}_1, \dots, \mathbf{x}_n\}$$

(inputs, features, ...)

**Problem**: Assuming the observations are independent, find the probability density  $p(\mathbf{x})$ .

#### Mixtures of Gaussians

#### Training the model

Likelihand:

$$p(x_{1:n} \mid T, b, \leq) = \prod_{i \neq 1} p(x_i \mid T, b, \leq)$$

$$= \prod_{i \neq 1} \left\{ \sum_{k \neq i} N(x_i \mid b_k, \leq b) \right\} \quad \text{fulles}$$

$$= \sum_{i \neq 1} \left\{ \sum_{k \neq i} N(x_i \mid b_k, \leq b) \right\} \quad \text{fulles}$$

### Log probability density: Density estimation with mixtures

## You can sample from the density

# You can use the model to do clustering
